FINANCE CAREER SIMULATOR | CREATOR BLUEPRINT | VERSION 1.0

THE STREET

From campus recruiting to a Wall Street career

A career-first Roblox experience where players build a profile, win an internship, trade fictional markets, survive performance reviews, earn promotions and choose their finance exit path.

55-65 HRS

Target: a meaningful level-100 journey in about 55-65 hours of active play. Players keep purchased cosmetics and achievements through career setbacks.

DESIGN PILLARS

A real career fantasy

College recruiting, investment banking, promotions and competitive exits.

Meaningful risk

Market performance can accelerate a career or put a job in danger.

Fashion and status

Earnable style, customizable offices and social prestige.

Fair monetization

Paid convenience and recovery, never paid market alpha or leaderboard score.

Prepared 15 October 2026 | Product strategy, progression, monetization, leaderboards and launch plan

01 / DESIGN SECTION

Product vision and session loop

The fantasy is not “click to earn.” It is building a career under pressure.

One-sentence pitch

Start as a college student with a randomly generated background, recruit into investment banking, make decisions in a fictional stock market, rise through promotions, and branch into a specialist finance career. Great performance opens doors faster; repeated poor decisions can lead to probation or being fired.

Core play session

Step	What the player does	Reward / consequence
1. Read the tape	Review fictional market news, earnings and daily catalysts.	Forms a hypothesis before trading.
2. Do the job	Complete a short valuation, pitchbook, research or deal minigame.	Career XP, work score, salary and reputation.
3. Make decisions	Buy, hold or sell fictional shares; manage exposure and risk.	Risk-adjusted trading score and virtual gains/losses.
4. Build a life	Shop outfits, customize desk / apartment and network with other players.	Visible identity and social roleplay.
5. Get reviewed	Receive a weekly performance review and promotion eligibility.	Promotion, coaching, probation or termination.

Four product pillars

- Career fantasy: each promotion changes the work, office access, deal scale and social status.
- Investment gameplay: information, uncertainty and risk management matter more than clicking speed.
- Personal identity: wardrobe, office design, profile card and career history are persistent reasons to return.
- Comeback stories: firing is a recoverable setback that changes the career narrative, not a deletion of the player’s whole account.

Design rule

Every 10-15 minutes, players should make a decision, earn a visible reward, unlock a new task or receive useful feedback. Do not stretch a 60-hour journey with repetitive timers.

02 / DESIGN SECTION

The pre-career background roll

Before choosing a firm, each player receives a profile card that influences their starting strengths and constraints.

The opening sequence is a short “profile builder.” It generates three profile packages from a pool of backgrounds. Players choose one; this creates a personal origin story without locking anyone out of the top career path.

Background field	Possible outcomes	What it changes
School tier	Regional public; strong state school; finance target; elite private; international university.	Recruiting events and initial interview odds, not market-return multipliers.
GPA	2.70-4.00, with a probability curve favoring plausible middle-high values.	Interview eligibility and one early academics assignment.
Major	Finance; economics; accounting; math / statistics; engineering; liberal arts.	Starting skill bonus and one tutorial style.
Hometown / region	Major financial hub; college town; regional city; international hub.	Networking opportunities, living costs and region-specific contacts.
Family background	Self-funded; stable middle-income; affluent; industry-connected family.	Starting safety net, networking access and lifestyle costs.
Natural strengths	Quantitative skill; communication; discipline; risk judgement; networking.	Small, visible starting modifiers with trade-offs.

Profile examples

Example profile	Strengths	Trade-off
“Target-school quant” 3.82 GPA; math major; regional hub.	Strong modeling; early recruiting invites.	Higher living cost; weaker networking confidence.
“Connected generalist” 3.45 GPA; business major; finance family.	Warm introductions; better mentor access.	Less starting capital; lower technical baseline.
“Self-made grinder” 3.55 GPA; engineering major; small city.	Discipline, low expenses, strong analytical growth.	Fewer initial contacts; needs more networking tasks.

Fairness constraint

Background should create different routes, not a dominant “best roll.” Balance each profile to similar expected power over the first 10 hours. A rich family may provide contacts but not a huge portfolio; a target school may open interviews but cost more.

03 / DESIGN SECTION

Stats, rolls, rerolls and recovery

Make the profile roll exciting, readable and monetizable without letting it determine the whole career.

Recommended starting stat model

Stat	Range	Gameplay use	Counterbalance
Quant	1-10	Financial modeling and research tasks.	Strong quant does not improve stock prices.
Communication	1-10	Networking, interviews and client pitch minigames.	Can be trained through repeated practice.
Discipline	1-10	Deadline reliability and avoiding preventable penalties.	Low discipline can improve with routines / assignments.
Risk judgement	1-10	Starting risk limit guidance and review score.	Does not predict future returns or remove uncertainty.
Network	1-10	Mentor access, referrals and informational interviews.	Earnable through social play and events.

Reroll design

- At setup: generate three candidate backgrounds and include one free reroll. Let the player compare the full profile before locking in.
- Earnable option: a Profile Refresh token from a campus challenge, seasonal goal or career milestone. Never make a single bad roll a permanent trap.
- Paid option A - Profile Reroll: 49 R$ as a test price. Since this is a Robux-funded random outcome, disclose every possible outcome and numerical odds, check Roblox PolicyService eligibility, and restrict purchase where required [4].
- Paid option B - Background Rebuild: 99 R$ test price. A deterministic editor lets the player select from eligible school / region / major / family archetypes. This is easier to understand than paid randomization.

Anything intentionally lost can be recovered

Lost / resettable system	Free recovery route	Optional paid recovery
Rolled background	Earn or use a free Profile Refresh token.	Profile Reroll / deterministic Background Rebuild.
Career rank after firing	Complete a re-entry interview and probation assignment.	Career Reinstatement restores previous rank eligibility.
Virtual capital wiped by game rules	Complete a recovery contract and rebuild from a smaller bankroll.	Capital Reconstruction restores a capped fraction, not leaderboard score.
Lost unsaved data due to a bug	Support restores confirmed legitimate progress at no charge.	Never charge for damage caused by the game or a platform failure.

Do not monetize accidental loss

Robux recovery is for intentional game outcomes only. Purchased cosmetics, permanent achievements and documented progress lost because of a bug must not be held hostage to a purchase.

04 / DESIGN SECTION

Career path and 55-65 hour level curve

Use level 100 as the cap. Early promotions arrive quickly; later promotions require skill and larger projects.

Level range	Role / path	Target cumulative active time	Unlock / competency
1-8	College Student	0-3 hours	School background, finance club, mock stock pitch, networking and interviews.
9-15	IB Intern	3-7 hours	Pitchbook formatting, research notes, data cleanup and initial market portfolio.
16-30	IB Analyst	7-17 hours	Valuation models, comparable companies, DCF, earnings reactions and live deal teams.
31-40	IB Associate	17-25 hours	Review analyst output, supervise transaction work and manage deadlines.
41-50	VP / Director / Managing Director	25-32 hours	Lead a deal, win client mandates and qualify for exit recruiting.
51-74	Specialist career	32-45 hours	Choose PE, Hedge Fund, VC, Real Estate or Corporate Development; master a distinct mechanic.
75-100	Partner / Portfolio Leader / Family Office	45-60 hours	Manage a portfolio of businesses or assets, complete signature projects and build a firm.

Promotion should be earned in multiple ways

- Standard route: complete core assignments, meet reputation requirements and pass a skills evaluation.
- Fast-track route: sustained risk-adjusted market performance, excellent work quality and completed signature deals reduce assignment requirements by up to 20%.
- Alternative route: weaker market results can be offset by excellent deal work and risk discipline; this prevents the game becoming a pure stock-price lottery.
- Career exits: after IB leadership, pick a specialist track. Alternate career records preserve previous achievements, while the selected path determines the current progression journey.

Endgame content

Level 100 should unlock more difficult contracts, firm customization, legacy goals and seasonal challenges rather than ending the game. The 55-65 hours is the core career journey, not the lifespan of the experience.

05 / DESIGN SECTION

Performance reviews, firing and The Wipeout

Bad investing can create consequences, but a single unlucky market swing should not erase a career.

Suggested review score

Review component	Weight	Server-calculated evidence
Risk-adjusted investment performance	35%	Excess returns vs. fictional benchmark, drawdown and volatility over a review window.
Risk management	25%	Position limits, leverage rules, concentration and response to warnings.
Work quality	25%	Model accuracy, deal assignment quality, research tasks and deadline reliability.
Team / client reputation	15%	Deal participation, networking events, mentoring and client-pitch quality.

Score	Status	Outcome
85-100	Star performer	Eligible for fast-track promotion, premier deal assignments and larger earned bonuses.
70-84	On track	Standard advancement.
55-69	Underperforming	Coaching tasks and no immediate promotion.
40-54	Probation	Risk limits tighten; improvement plan; next review is high stakes.
Below 40 twice	Critical / fired	Current role ends; employment recovery options become available.

The Wipeout rules

- Trigger dismissal after two critical reviews, or after a major repeated risk-limit violation that the player ignored after warnings.
- Consequences may remove current job status, active deal pipeline, a portion of current career XP and virtual trading capital. Explain the exact loss before the final confirmation.
- Never remove Robux-purchased outfits, permanent cosmetics, badges, earned career history or account-level achievements.

Recovery routes

Route	Cost	Effect
Re-entry interview	Free	15-25 minute recovery sequence, rejoin one rank lower with modest capital.
Career Reinstatement	Suggested 99-149 R$	Restore former title and rank eligibility; still complete probation and rebuild the portfolio.
Capital Reconstruction	Suggested 49-99 R$	Restore a capped portion of lost career cash. Exclude paid/restored capital from competitive scores.
Fresh start	Free	Return to student / intern; preserve permanent cosmetics and career history.

Avoid pay-to-not-lose pressure

Show all recovery options in a neutral career-services screen. No automatic purchase pop-up on firing, no countdown pressure and no purchase required to continue playing.

06 / DESIGN SECTION

Fictional market, deals and specialist realms

Every division needs a distinct loop, not just a new office backdrop.

Fictional market model

- Use made-up companies and sectors: Apex AI, Meridian Bank, Volt Automotive, Summit Properties and Titan Energy. No actual money or real-stock integration.
- Prices move from disclosed fundamentals, scheduled earnings, broad market events and limited uncertainty. Players analyze information rather than guess an entirely opaque random chart.
- Track cash, invested value, realized P/L, unrealized P/L, drawdown, benchmark return and risk-adjusted score separately.
- Risk controls: concentration limits, warnings, optional stop orders, and review windows long enough that one random move does not decide employment.

Signature deal examples

Realm	Signature project	Distinct mechanic
Investment Banking	Take a fictional company public.	Build valuation, prepare pitchbook, respond to buyer questions.
Private Equity	Acquire and improve a struggling company.	Purchase price, financing mix, operational improvement and exit timing.
Hedge Fund	Outperform a benchmark without breaching risk limits.	Portfolio allocation, research catalysts and drawdown control.
Venture Capital	Select startups across funding rounds.	Probability-weighted outcomes, founder meetings and portfolio construction.
Real Estate	Buy, renovate and lease an office building.	Budgeting, occupancy, rent and cap-rate tradeoffs.
Corporate Development	Recommend an acquisition to a board.	Strategic fit, valuation, integration risk and deal approval.

Lifestyle progression

Players earn ordinary clothing, watches, accessories, desk items and apartment upgrades with in-game salary cash. Robux cosmetics add new styles and customization options, not career score or stock-market intelligence.

07 / DESIGN SECTION

Monetization architecture

Monetize personalization and convenience; do not sell guaranteed market alpha.

Product	Suggested test price	What it provides	Guardrail
Profile Reroll	49 R$	Randomized new background profile.	Must disclose outcomes / odds and enforce paid-random restrictions [4].
Background Rebuild	99 R$	Choose new eligible school / major / family / region archetype.	Deterministic; no hidden rarity tier.
Career Reinstatement	99-149 R$	Restore previous title / rank eligibility after an intentional wipeout.	Probation remains; exclude paid recovery from rankings.
Capital Reconstruction	49-99 R$	Restore a capped portion of lost in-game capital.	Never counts toward competitive performance leaderboard.
Outfit bundle	149-249 R$	Complete suit, quarter-zip, watch, shoes and accessories.	Direct purchase, preview before buying.
Office theme / decor pass	149-249 R$	Additional desk, office and room styles.	Cosmetic-only.
Season pass	199-249 R$	Free + premium reward tracks for cosmetic collections.	Clear rewards, no paid random crate.
Executive Club	399-599 R$	VIP lounge theme, profile frame, outfit presets and cosmetics.	No trading multiplier or salary multiplier.

Robux-to-value rules

- All products explain exact contents before purchase. Use Roblox Developer Products for repeatable items and Passes for one-time entitlements [5].
- No Robux purchase increases stock returns, gives an exclusive source of market information, or directly improves risk-adjusted leaderboard scores.
- Every intentional resettable/lost gameplay resource gets a free earn-back route and a clearly defined optional recovery purchase, where appropriate.
- Bug-related losses are restored through support at no charge. Paid recovery should never replace good save reliability.

Launch shop size

Start with 6-8 clear products, not a crowded store. Add items only when player testing shows that the underlying game loop is retaining users.

08 / DESIGN SECTION

Global leaderboards and social competition

Rank players on skill and verified play, not on how much Robux they spend.

Leaderboard	Scoring method	Integrity rule
Career Prestige	Server-verified promotions, completed signatures and permanent milestones.	Exclude purchased ranks / recovery bonuses from score.
Market Skill - Season	Risk-adjusted return vs. benchmark over a standard season.	Equalized starting portfolio; minimum activity threshold.
Deal Mastery	Quality points from verified deal projects.	Server grants scores only after requirements complete.
Fastest Career Run	Time to level 100 on a standardized challenge profile.	Fixed seed / standard starting capital; seasonal reset.
Comeback Board	Successful returns after a wipeout, measured by earned recovery milestones.	No points merely for buying reinstatement.

Implementation plan

- Use server-side score calculation and OrderedDataStore / persistent global ranking infrastructure. Roblox documents persistent Global rankings and OrderedDataStores; availability and built-in leaderboard constraints should be checked against the current Creator Hub setup [1][2].
- Build custom in-world boards for multiple categories, since Roblox’s built-in PlayerList global view has constraints and may support only one registered active persistent leaderboard per experience at a time [1].
- Refresh display boards on a controlled interval; cache reads; do not call global data services every frame.
- Add seasonal, friends-only and regional filters in custom UI where data volume and moderation permit.

Abuse controls

- The server validates purchases, inventory changes, trade actions, score updates and review outcomes. The client never tells the server its own “final score.”
- Flag impossible returns, implausible trade volume, teleport / timer exploits and repeated disconnect abuse. Keep a human review and appeal path for leaderboard bans.

Leaderboard UI

Show rank, player name, stat, time window and season. Reset seasonal competition without wiping permanent profile achievements.

09 / DESIGN SECTION

Technical architecture and persistence

The economy is only as trustworthy as its save and transaction systems.

System	Server-owned data	Implementation notes
Player profile	Background roll, school tier, GPA, skill attributes, current role.	Store in standard DataStore; version schema and validate every field [3].
Career state	Level, reputation, promotion history, probation status, specialist path.	Only server-authoritative code updates progression.
Portfolio ledger	Cash, positions, transaction history, P/L, benchmark series.	Server controls prices and fills; use transaction IDs to avoid duplicate trades.
Inventory / entitlements	Cosmetics, outfit bundles, pass ownership and recovery purchases.	Grant after verified receipt; make purchase processing idempotent [5].
Leaderboard score	Career prestige, normalized returns, deal score, season ID.	Write numeric values to ordered data stores from server code [1][2].
Audit / support	Review history, wipeout reason, restore action and product receipt.	Keep enough history to resolve disputed purchases or lost progress.

Build safeguards

- Use server-authoritative market clocks and price updates. Do not let local client time determine returns or review deadlines.
- Design an explicit state machine: Active -> Review Due -> Coaching / Probation -> Fired -> Re-entry / Reinstated.
- Apply rate limits and input validation to remotes; never trust client-supplied price, currency amount or leaderboard value.
- Autosave at sensible checkpoints, save on leave and use recovery-safe data writes. Roblox DataStores persist data between sessions and server-side calls protect the data boundary [3].
- Test duplicate purchase receipts, server shutdowns during saves, invalid values, rejoining mid-trade and old schema migrations before launch.

10 / DESIGN SECTION

Launch roadmap, metrics and balance tests

Build a narrow, reliable version before expanding into every finance realm.

Phase	Deliverable	Exit gate
Prototype	Campus profile roll, one office, fictional stock terminal, 3 work tasks.	New players can explain the loop and enjoy the first 20 minutes.
Vertical slice	IB internship, promotion, review score, portfolio persistence and basic wardrobe.	No data loss in reconnect / shutdown tests; market cannot be client-exploited.
Progression test	Levels 1-30, early career, one signature deal and first wipeout recovery.	Median engaged testers see meaningful change every 10-15 minutes.
Economy test	Profile rerolls / editor, recovery products, outfit shop and leaderboards.	Purchases grant correctly; paid values excluded from competitive score.
Soft launch	Complete IB-to-exit arc, then add one specialist branch.	Monitor retention, quits after firing, promotion completion and return rate.
Expansion	Add PE / HF / VC / RE branches, seasons and lifestyle content.	Each realm delivers a distinct loop, not simply a visual reskin.

Core metrics

- D1 / D7 / D30 retention; average active session length; first assignment and first promotion conversion.
- Time-to-first-fashion-purchase using earnable currency; outfits saved; returning players who customize.
- Career promotion rate by cohort; share reaching a new realm; median time to level 100, targeting 55-65 active hours for engaged players.
- Firing rage-quit rate; free vs. paid recovery rate; post-recovery return rate. If firing produces a sudden exit spike, soften penalties before raising recovery prices.
- Payer conversion, ARPPU, ARPDAU, refund / failed receipt rate and cosmetic revenue by collection.

Decision priority

If retention falls, fix the job loop, feedback or progression before adding more monetization. A larger shop cannot repair an unfun first session.

11 / DESIGN SECTION

Platform references and working assumptions

References checked 15 October 2026. Re-check official documentation before implementation.

The prices and playtime estimates in this blueprint are prototype hypotheses, not guarantees of conversion or retention. Platform rules, service availability and supported pricing mechanics can change. The source links below are the implementation starting points.

Open design questions to validate in playtests

- Should family background meaningfully affect starting cash, or should it only affect contacts and expenses? Prefer a low-impact cash effect.
- Is a 55-65 hour target still fun for players who only want market / fashion gameplay? Provide alternate goals that do not require level 100.
- Does paid reinstatement feel like a convenience or a penalty toll? If testers describe it as a toll, lower the wipeout punishment instead of pushing purchase conversion.
- Which specialized finance path gets the highest organic selection and repeat play? Use that to choose the first expansion.

North star

Players should tell friends about the career they built, the deal that saved them, or the comeback after getting fired - not about a purchase they felt forced to make.
